Meeting 11/12 notes

What we did:
      Ian - finished homepage styling, bugfixing routes
      Maya - tested/implemented user registration
      Felix - getting map connected to database (have map pull up data of logs)
      Matthias - user log in+ activity/profile pages
      Davion - worked on plant log page, log database

Clarified plant search page; searching a species would bring up plant information & logs of that species, separate from just going straight to the map to search logs

To do:
- Divide up pages to implement individually
- Ian - implement search bar, put a link to the search map on the home page
- Maya - work on plant [species] search page, with map of logs for that plant
- Felix - connecting map to database
- Matthias - continue working on profile/activity pages, have activity page show user's log of plants (which links to the species search page)
- Davion - continue working on add plant log page
