What is Verdant?

Our application is an organized and convenient way for plant enthusiasts to track plants they encounter

- Log details including name, scientific name, images, etc...
- Include geographic location of plant
- Interactive map to view plants

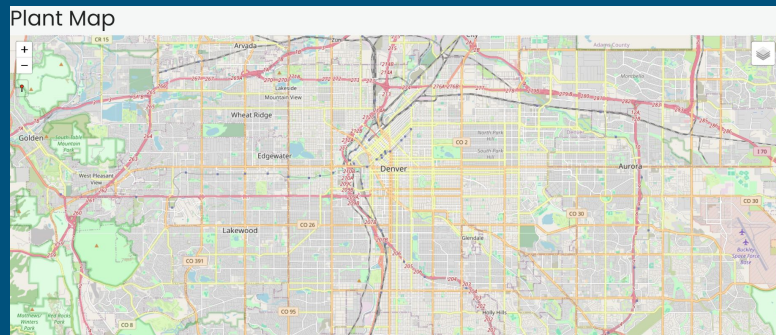

Tools Used

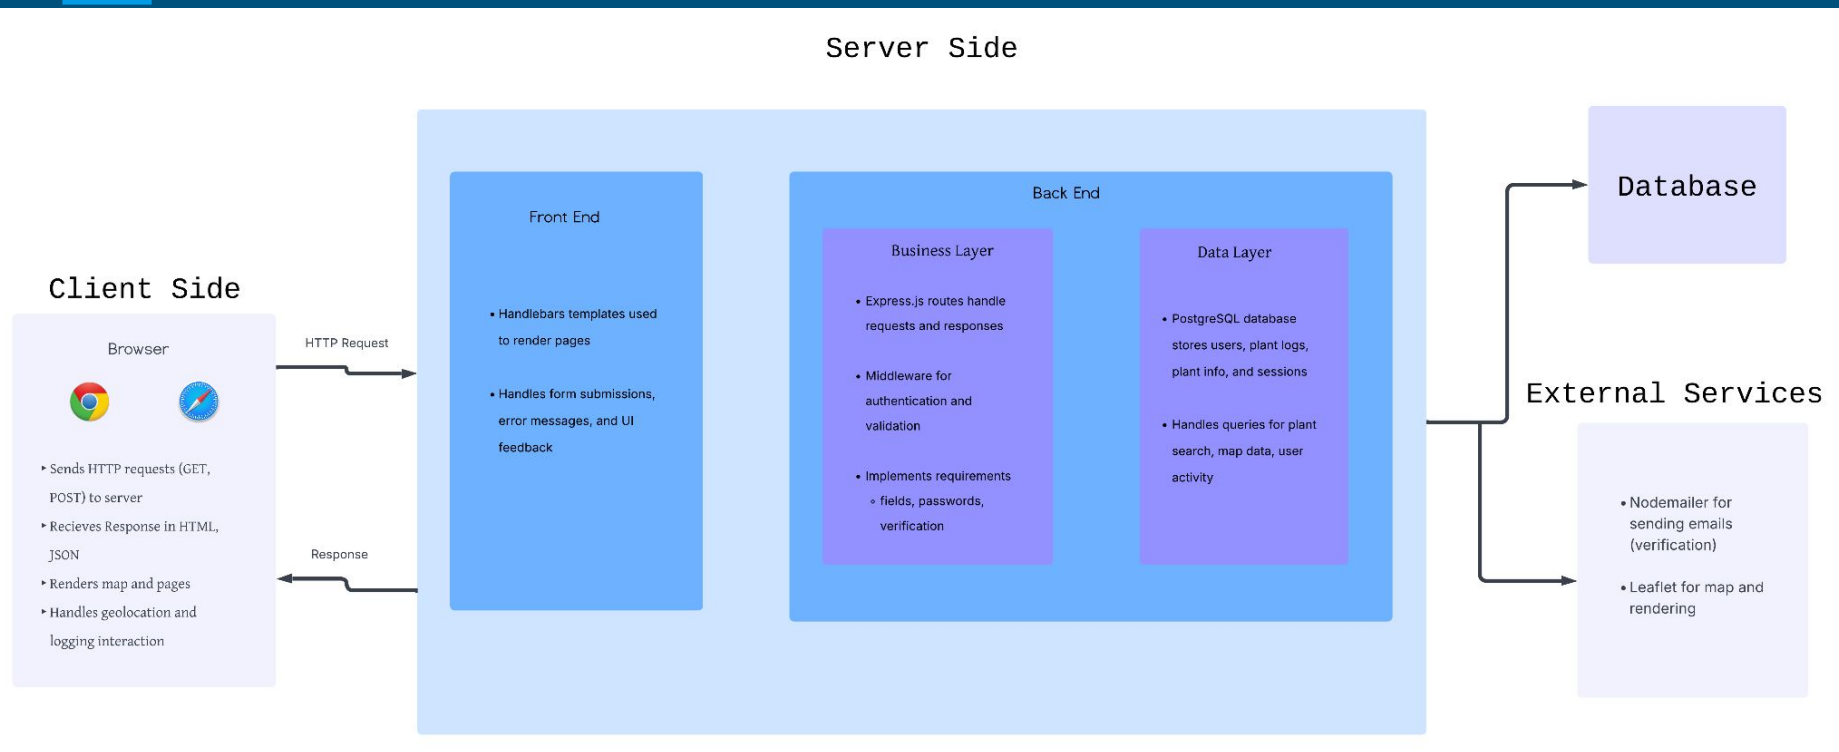

VCS repository	★★★★★	GitHub	
Database	★★★★☆	PostgreSQL	
IDE	★★★★☆	Eclipse	
UI Tools	★★★★☆	mostly HandleBars and a little HTML	
Application Server	★★★★★	NodeJS	
Deployment environment	★★★★☆	Render	
External APIs	★★★★☆	leaflet.js	
Framework	★★★★☆	Express in Node	
Testing tool	★★★★☆	Chai	
Project Tracker	★★★★★	GitHub	

Methodology

- Weekly meetings with TA Wednesdays @ 12:45 and team meetings on zoom on Wednesdays
- Communication over discord to discuss progress and bug fixes
- Using github tracker to track progress and what is left
- Agile development with evolving roles

Architecture

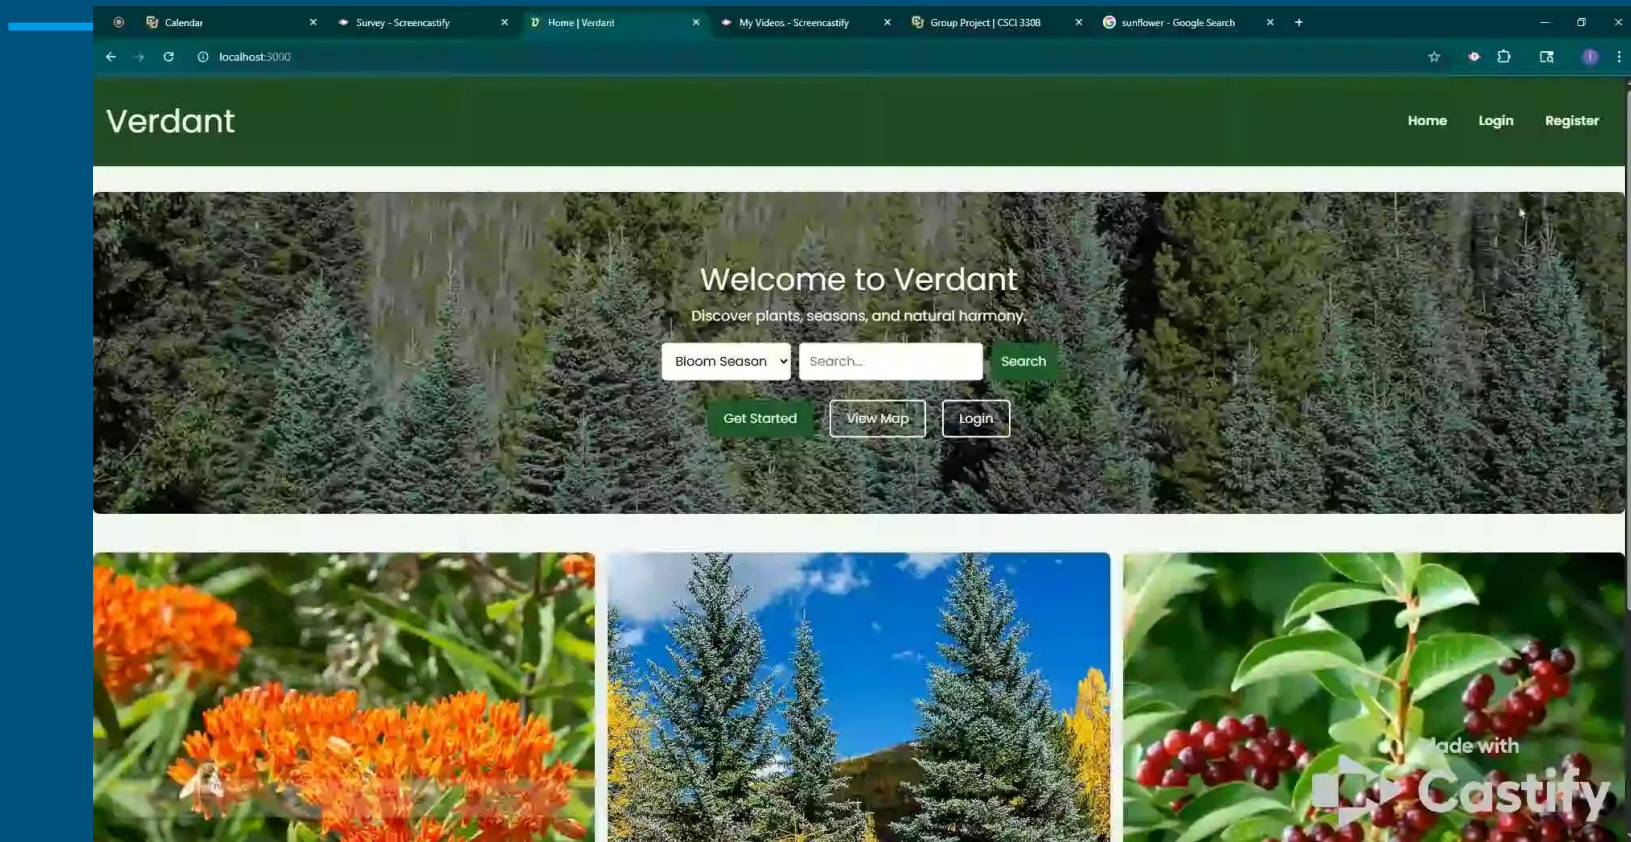

Challenges

- We ran into many problems with the database during the initialization process. We overcame this very gradually, fixing a multitude of bugs as a group. This resulted in us having much less time to design and test certain back-end features.
- Getting the map feature up and running was a challenge all on it's own. While leaflet.js was relatively intuitive, learning all the ins and out, such as how to add the pop ups, and how to add different layers required a steep learning curve.
- Organization of team roles was a struggle, group members would often change roles, requiring flexibility from the group. This didn't impact the scope of the project as much, but was still something of note.

Future Scope

- An edit feature for logging plants, which enables to save changes to logs already existing
- Add in an option to access gps when logging a plant
- Allow other users to interact with each other's plants, such as commenting
- Allowing a feature for users to organize their own plants / store them more efficiently
 - For consistent users this may provide better user experience of the application
